BLACK POLYPROPYLENE

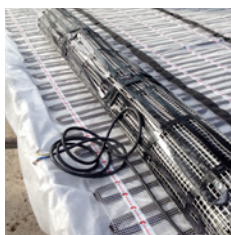

Thanks to Warmset's Black Polypropylene specialized in greenhouse, nursery and farmland heating, the use of electricity is really **easy** and **affordable** for heating areas designated for cultivation.

It's so **easy** because the electric heating system is so user-friendly that it can be set on the pallet and removed in just a few minutes. It is so affordable because of the **savings** on boiler installation, for example, which would guarantee heating of water and the relative pipes the water circulates through.

Compared to the other heating systems usually used in greenhouses, Warmset's Propylene Black guarantees a **better energy yield**, since the heating element is a flat conductor which thanks to its shape offers a very large surface of heat exchange.

The Warmset greenhouse and nursery heating system was **designed** and **experimented** for an entire series of horticultural, floricultural and "aromatic" species thanks to the collaboration with the **Regional Center of Experimentation and Agricultural Assistance of Savona**.
